

Collibra Setup Guide

Document Information

Field	Value
Document Title	[Organization Name] Collibra Data Governance Platform Setup Guide
Version	1.0
Effective Date	[Insert Date]
Review Date	[Insert Date - Recommend Annual]
Owner	[Data Catalog Administrator]
Approved By	[Chief Data Officer]
Classification	Internal Use

Important: This guide provides organization-level configuration guidance aligned with the governance framework in this repository. Always follow Collibra's official documentation and your license/support agreement for product-specific instructions, as features and UI vary by version.

Purpose

This guide maps [Organization Name]'s data governance framework (charter, classification scheme, stewardship model) onto Collibra's platform configuration, so the tool reinforces — rather than duplicates or conflicts with — the governance program defined in this repository.

1. Pre-Implementation Checklist

- ☐ Data Governance Charter approved and Data Governance Council established
- ☐ Data Classification Scheme finalized
- ☐ Initial business domains and Data Steward assignments identified
- ☐ Source systems prioritized for initial onboarding (start with the pilot domain per the Implementation Roadmap)

2. Domain and Community Structure

Map the governance organizational structure into Collibra's Community/Domain model:

Governance Concept	Collibra Equivalent
Business Domain (e.g., Customer, Finance)	Community
Data Asset Type (Table, Report, File)	Asset Domain within Community

Governance Concept	Collibra Equivalent
Business Glossary	Glossary Domain
Classification Levels	Attribute/Classification Domain

Recommended structure: Create one Community per business domain defined in `business\_domains` (see Data_Catalog_Setup_Scripts.sql), with sub-domains for Business Terms, Data Assets, and Policies.

3. Role Mapping

Governance Role	Collibra Role
Chief Data Officer	Workflow Owner / Community Owner (top-level)
Business Data Steward	Steward (Community/Domain level)
Technical Data Steward	Technical Steward / Data Owner
Data Governance Office	Admin + Workflow Manager

Configure Collibra's Responsibility model so each asset has at minimum a Steward and Technical Steward assigned, matching the `business\_steward\_id` / `technical\_steward\_id` fields in the catalog schema.

4. Classification and Policy Configuration

- ☐ Configure a Classification attribute matching the four levels in the Data Classification Scheme (Public, Internal, Confidential, Restricted)
- ☐ Link each Classification level to its handling requirements as a Policy asset
- ☐ Configure workflow approval steps requiring Steward sign-off before an asset's classification is finalized

5. Glossary and Business Term Configuration

- ☐ Migrate approved business definitions into the Business Glossary, organized by Community/domain
- ☐ Configure approval workflow: draft → steward review → published
- ☐ Link glossary terms to corresponding physical data assets (columns/tables) for traceability

6. Lineage Configuration

- ☐ Connect Collibra's lineage harvesting (e.g., via Collibra Data Lineage or supported ETL/BI connectors) to source ETL/BI tools
- ☐ For systems without native harvesting support, manually register lineage relationships using the structure in Data_Lineage_Mapping_Templates.xlsx

- ☐ Validate harvested lineage against known critical data flows (e.g., source -> warehouse -> reporting) before relying on it for compliance reporting

7. Data Quality Integration

- ☐ Configure Collibra Data Quality (or your chosen quality engine) to evaluate the rules defined in the Data Quality Rules Library
- ☐ Map rule results into Collibra asset quality scorecards
- ☐ Configure alerting/workflow triggers for quality scores falling below the SLA threshold (see Compliance Reporting Scripts for the threshold logic)

8. Workflow Configuration

Configure or customize the following standard workflows:

- **Asset registration and certification** — new assets require Steward review before being marked "Certified"
- **Issue management** — routes to the Data Issue Resolution Process severity/owner model
- **Access request** — implements the Data Request Workflow swimlane process

9. Integration Points

System	Integration Purpose
Data Warehouse / Data Lake	Technical metadata harvesting
ETL/ELT Tools (e.g., Informatica, Talend)	Lineage harvesting
BI Platform (e.g., Power BI)	Report-level lineage and usage metadata
Identity Provider (SSO)	User provisioning and role mapping

10. Rollout and Adoption Checklist

- ☐ Pilot domain configured and validated end-to-end (registration → classification → lineage → quality)
- ☐ Data Stewards trained per the Data Steward Training Curriculum (Module 3: Tools & Systems)
- ☐ Reporting dashboards configured to match KPI Dashboard Templates
- ☐ Go-live communication issued per the Stakeholder Communication Plan

Document Control:

- This is a template document requiring customization for your specific Collibra edition/version
- Always consult official Collibra documentation and your Collibra support team for product-specific steps
- Not affiliated with or endorsed by Collibra; "Collibra" is a trademark of its respective owner
- Regular updates required to maintain currency and effectiveness
